
In this blog post, we will be looking at the Mitsubishi Plc Password Cracker. The Mitsubishi Plc Password Cracker is a tool made by Thomas Brown for cracking password hashes from the password files of encrypted data stored on company servers. In order to crack a hash, it is needed to have a hash dictionary in order to compare passwords against that dictionary in order to find one that matches. Additionally, the word list must be created in such a way that allows for quick searching and finding of common words. The word list used in the Mitsubishi Plc Password Cracker is called the MICT Dictionary. You can find more information on how to use this wordlist found on the following website: <http://pep.physics.ox.ac.uk/data/mict.dat> ... The Mitsubishi Plc Password Cracker uses brute force search, brute force search uses many strings in order to identify the maximum possible password within a given length which usually ends up with either a dictionary or dictionary + common words combination. The process will initially use a dictionary to compare against, as well as a wordlist and then will constantly move on to guesses until it either finds a password that matches the given length or the end of the password. The Mitsubishi Plc Password Cracker and all output can be found within this ZIP file: <https://pivotaltracker.com/projects/MitsubishiPlcPasswordCracker/Unzip> This tool can be used for pasting passwords from files containing text such as Word documents, PDF files, emails, etc... You can also use this to crack hashes from encrypted file such as ZIP archives. There are many tools that are used for cracking passwords but none are as convenient as this one. The following section will outline the features of the Mitsubishi Plc Password Cracker. The Mitsubishi Plc Password Cracker allows you to search for passwords within a list of hashes that have been tested by an expert or someone who hacks password databases. Because of this, the list is very large and contains common words along with user names, email addresses, etc... When converting your wordlist to hashes, just remember to use lowercase characters for all letters except numbers, since they are case insensitive. Currently, the password list contains around 40,000 different passwords. In order to use the Mitsubishi Plc Password Cracker, it is needed to have a list of hashes to test against the passwords from your wordlist. In order to generate this file you can use programs such as John The Ripper, RainbowCrack or hashcat. For example if you have a wordlist called "wordlist" and a directory where all hashes reside: "/root/hashes", then you will need to do first: Then you can run the Mitsubishi Plc Password Cracker with the following command: The Mitsubishi Plc Password Cracker will then show all possible passwords that could be used for cracking. mitsubishi plc password cracker
